

Sprint 4 Burndown Chart

We first held a sprint meeting where we discussed which stories to take and each assigned points to the story. We decided to complete the two stories that were unfinished from previous sprints and take five other user stories to complete our project.

After this, everyone collaboratively took tasks on a first-come-first-serve basis. Tasks were completed, pull requests were made, reviewed, and then team members took upon new tasks in the same format. In case of doubts, each member was willing to help and debug together when required.

We started the sprint pretty late because of a blocker of Assignment 2, which is shown on the horizontal line from July 20 to 27. However, after that, we completed our tasks throughout the week, and thus we can see that the vertical spike downwards was spread over the last few days. Though we decided to move some of the tasks from in-progress to done on the last day to make sure there were no potential bugs or errors, which caused the vertical spike downwards towards the last day.
