

SPRINT 3 BURNDOWN CHART

We first held a sprint meeting where we discussed and each assigned points to stories. The stories with the points that had the most votes were assigned that specific number of story points. After this, everyone had taken upon one task at a time on a first-come-first-serve basis. Tasks were completed, pull requests were made, reviewed and then team members took upon new tasks in the same format. Everyone collaborated, asked for help and helped each other out when required.

We completed our tasks throughout the week but only decided to move tasks from in-progress to done on the last day to make sure there were no potential bugs or errors. This caused a large vertical spike downwards in the burndown chart on the very last day of the sprint.

Going forward, we will complete the 2 unfinished user stories and take the remaining tasks based on both difficulty and priority instead of either one.
