# Sprint 2 Burndown Chart

Although user stories were assigned points at the beginning of the sprint, we could not work on them until a week after.

This was due to midterms, assignments and reading week and this is the main reason why the actual velocity differs from the main velocity.

We did complete our tasks throughout the week but only moved tasks from in-progress to done on the last day. This was because we wanted to check for any potential bugs or errors before finally moving the tasks to done.

This caused a large vertical spike downwards in the burndown chart.

However, we accounted for this block of midterms and assignments by taking 3 uncompleted user stories from the previous sprint and strategically selecting 3 more user stories from the product backlog, with the goal of completing at least 2 of the 3 new user stories.

Going forward, we will complete the uncompleted user story and take the remaining 4 user stories based on priority instead of difficulty as we no longer have a lot of assignments and midterms within the next 2 weeks (sprint 3 period).
